Decisions

Copy Page

Turn text and images into decisions your application can use, 10x faster than the Responses API.

The Decisions API is now generally available. Review what's new since the public beta.

The Decisions API evaluates text, images, and JSON and returns typed answers about 10x faster than the Responses API. Get the probability that a condition is true, a choice from a fixed set, or a score against a rubric. Use those answers to classify content, route requests, and prioritize work in your application.

Try the Decisions API in the Playground to experiment with questions and inputs before writing code.

Send requests to `POST /v1/decisions` using `gpt-6-luna`, the only currently supported model.

What's new

Since the public beta launched, the Decisions API has added these capabilities:

- **Prompt caching.** Reuse shared input across requests and receive cache discounts.
- **Images in question instructions.** Give each question its own images to compare against shared evidence.
- **JSON input.** Pass structured data directly with an `input_json` content part.
- **More questions per request.** Ask up to 400 questions per request, up from 200 during the public beta.
- **Hosted image inputs.** Pass publicly accessible HTTP or HTTPS image URLs as well as inline base64 data URLs.
- **Conversation history.** Evaluate messages alongside function calls, custom tool calls, and their outputs.
- **Organization usage reporting.** Track token usage and request counts.
- **Native GPT-Live integration.** Let Live call Decisions directly, or trigger decisions as
